Vlietstra,Jakob Vlietstra,1997 My first encoWlter with acronyms took place when I was ten years old and growing up in an occupied COWltry during the Second World War My father proudly annoWlced one day that despite the ban imposed by the occupying administration he had managed to get a radio installed and could receive the BBC All acronyms used in this introduction are listed in this dictionary To me the meaning ofBBC was that we would receive different information about the war than we got from the usual censored broadcasts There was of course the well known acronym associated with the nT but at that time I did not realize that it meant more than the postal service in those years a deteriorated service Gradually the daily use of acronyms grew Most of the newly acquired three and four letter abbreviations referred to organiza tions such as the broadcasting corporations in The Netherlands and Belgium and references to coWltries such as the USA USSR and UK When attending high school the HBS after the war my knowledge of acronyms grew slowly Even during the ten years I spent in the Dutch Merchant Marine the GHV the number of acronyms was limited to ad vanced equipment that eventually became known as RADAR LORAN and DECCA *Wireless Data Demystified* John Vacca,2003-01-03 Wireless data the high speed transfer of email stock information messages and even video and audio across wireless networks is expected to become a 7 5 billion business within the next three years This resource unpacks the networks technologies and protocols that make it all possible and explains how to cash in on this massive new telecom market Includes basic network deployment and design concepts Covers implementing fixed wireless and WLL wireless local loop Details managing and maintaining high speed wireless data networks Resource Provisioning and Dynamic Optimization of Network Slices in an SDN/NFV Environment Nazih Salhab,2020 To address the enhanced mobile broadband massive and critical communications for the Internet of things Fifth Generation 5G of mobile communications is being deployed nowadays relying on multiple enablers namely Cloud Radio Access Network C RAN Software Defined Networking SDN and Network Function Virtualization NFV C RAN decomposes the new generation Node B into i Remote Radio Head RRH ii Digital Unit DU and iii Central Unit CU also known as Cloud or Collaborative Unit DUs and CUs are the two blocks that implement the former 4G Baseband Unit BBU while leveraging eight options of functional splits of the front haul for a fine tuned performance The RRH implements the radio frequency outdoor circuitry SDN allows programming network s behavior by decoupling the control plane from the user plane and centralizing the flow management in a dedicated controller node NFV on the other hand uses virtualization technology to run Virtualized Network Functions VNFs on commodity servers SDN and NFV allow the partitioning of the C RAN transport and core networks as network slices defined as isolated and

virtual end to end networks tailored to fulfill diverse requirements requested by a particular application The main objective of this thesis is to develop resource provisioning algorithms Central Processing Unit CPU memory energy and spectrum for 5G networks while guaranteeing optimal provisioning of VNFs for a cloud based infrastructure To achieve this ultimate goal we address the optimization of both resources and infrastructure within three network domains 5G Core Network 5GC C RAN and the SDN controllers We first formulate the 5GC offloading problem as a constrained optimization to meet multiple objectives virtualization cost processing power and network load by making optimal decisions with minimum latency We optimize the usage of the network infrastructure in terms of computing capabilities power consumption and bitrate while meeting the needs per slice latency reliability efficiency etc Knowing that the infrastructure is subject to frequent and massive events such as the arrival departure of users devices continuous network evolution reconfigurations and inevitable failures we propose a dynamic optimization using Branch Cut and Price while discussing objectives effects on multiple metrics Our second contribution consists of optimizing the C RAN by proposing a dynamic mapping of RRHs to BBUs DUs and CUs On first hand we propose clustering the RRHs in an aim to optimize the downlink throughput On second hand we propose the prediction of the Power Headroom PHR to optimize the throughput on the uplink We formulate our RRHs clustering problem as k dimensional multiple Knapsacks and the prediction of PHR using different Machine Learning ML approaches to minimize the interference and maximize the throughput Finally we address the orchestration of 5G network slices through the software defined C RAN controller using ML based approaches for all of classification of performance requirements forecasting of slicing ratios admission controlling scheduling and adaptive resource management Based on extensive evaluations conducted in our 5G experimental prototype based on OpenAirInterface and using an integrated performance management stack we show that our proposals outperform the prominent related strategies in terms of optimization speed computing cost and achieved throughput
