

Generalized Estimating Equations

Introduction

The generalized estimating equations (GEE) methodology, introduced by Liang and Zeger (1986), enables you to analyze correlated data that otherwise could be analyzed as a generalized linear model. GEEs have become an important strategy in the analysis of correlated data. These data can come from longitudinal studies, in which subjects are measured at different points in time, or from clustering, in which measurements are taken on subjects who share a common characteristic, such as belonging to the same class. **GENMOD** software provides two procedures that enable you to perform GEE analysis: the **GENMOD** procedure and the **GEE** procedure. Both procedures implement the standard generalized estimating equations approach for longitudinal data; this approach is appropriate for complete data or when data are missing completely at random (MCAR). When the data are missing at random (MAR) for weighted GEE analysis, which is implemented in the **GEE** procedure, procedure-level selection. The weighted GEE method is described by Mullebach and Sauerborn (2001), Fienberg, Luan, and Zhou (2001), Mullebach, Liu, Li, Li, and Li (2004), and Sauerborn (2004).

The GENMOD Procedure

The **GENMOD** procedure enables you to perform GEE analysis by specifying a **WEIGHTED** statement to reflect your primary sampling information and a **WEIGHT** statement to reflect the generalized linear model structure you used in the working subset. Both model-based and nonmodel-based forms of the generalized estimating equations are provided. Many correlation structures are available, including first-order autoregressive, multivariate, independent, α -dependent, and unstructured. You can also input your own correlation structure. The **GENMOD** procedure also provides the following:

- Test the zero-inflated model.
- **CONTRAST**, **LSMEANS**, and **ESTIMATE** statements.
- Alternative logistic regression estimates.
- **WEIGHT** for robust data.

The proportional odds model is a popular method of GEE analysis of ordinal data and is based on modeling cumulative logit functions. The **GENMOD** procedure also enables cumulative logits and cumulative complementary log-log functions.
