Advanced Research on Energy Materials and Material Application Helen Zhang, David Jin, X.J. Zhao, 2012-10-08

Selected peer reviewed papers from the 2012 International Conference on Energy Materials and Material Application EMMA 2012 September 17-18 2012 Wuhan China Modeling and Optimal Control of Heavy-Duty Powertrains Vaheed

Nezhadali, 2016-05-30 Heavy duty powertrains are complex systems with components from various domains different response times during transient operations and different efficient operating ranges To ensure efficient transient operation of a powertrain e.g. with low fuel consumption or short transient duration it is important to come up with proper control strategies In this dissertation optimal control theory is used to calculate and analyze efficient heavy duty powertrain controls during transient operations in different applications This is enabled by first developing control ready models usable for multi phase optimal control problem formulations and then using numerical optimal control methods to calculate the optimal transients Optimal control analysis of a wheel loader operating in a repetitive loading cycle is the first studied application Increasing fuel efficiency or reducing the operation time in such repetitive loading cycles sums up to large savings over longer periods of time Load lifting and vehicle traction consume almost all of the power produced by a diesel engine during wheel loader operation Physical models are developed for these subsystems where the dynamics are described by differential equations The model parameters are tuned and fuel consumption estimation is validated against measured values from real wheel loader operation The sensitivity of wheel loader trajectory with respect to constraints such as the angle at which the wheel loader reaches the unloading position is also analyzed A time and fuel optimal trajectory map is calculated for various unloading positions Moreover the importance of simultaneous optimization of wheel loader trajectory and the component transients is shown via a side to side comparison between measured fuel consumption and trajectories versus optimal control results In another application optimal control is used to calculate efficient gear shift controls for a heavy duty Automatic Transmission system A modeling and optimal control framework is developed for a nine speed automatic transmission Solving optimal control problems using the developed model time and jerk efficient transient for simultaneous disengagement of off going and engagement of in coming shift actuators are obtained and the results are analyzed Optimal controls of a diesel electric powertrain during a gear shift in an Automated Manual Transmission system are calculated and analyzed in another application of optimal control The powertrain model is extended by including driveline backlash angle as an extra state in the system This is enabled by implementation of smoothing techniques in order to describe backlash dynamics as a single continuous function during all gear shift phases Optimal controls are also calculated for a diesel electric powertrain corresponding to a hybrid bus during a tip in maneuver It is shown that for optimal control analysis of complex powertrain systems minimizing only one property such as time pushes the system transients into extreme operating conditions far from what is achievable in real applications Multi objective optimal control problem formulations are

suggested in order to obtain a compromise between various objectives when analyzing such complex powertrain systems

The Effect of Overloading on Reliability of Wheel Loader Structural Components Eric Raymond Achelpohl,2018 This research attempts to provide a fundamental understanding into the relationship between the productivity of material handling equipment specifically wheel loaders and their ability to operate reliably when subjected to high overload conditions The overall aim is to determine the effect of overloading the bucket on wheel loader reliability The specific objectives of the research are to 1 evaluate the effect of overloading the bucket on wheel loader productivity 2 examine the effect of overloading the bucket on hydraulic pressures in the hoist cylinders used as a proxy for forces on a wheel loader and 3 investigate the effect of overloading the bucket on the reliability of structural components of a wheel loader To achieve these objectives the research used data from on board equipment monitors from the global fleet of ultra class wheel loaders for a specific original equipment manufacturer to test the various research hypotheses The data included production data failure and repair data and hydraulic cylinder pressures which were used as a proxy for stresses on structural components ANOVA and Pearson and Spearman correlations tests were performed on data samples to test the hypotheses Duty cycle relationships were established using linear life stress relationships ratios for the wheel loaders structural components The research showed that while higher bucket loads increase productivity there is evidence that they slow down the loading cycle may be detrimental to productivity The hoist cylinder pressure increased with increasing payload weight The reliability of the structural components was similar in both the standard and duty cycle cases although the accuracy of the reliability models increased when the models accounted for duty cycles Abstract page iii
