Critical Digital Humanities James E Dobson, 2019-03-16 Can established humanities methods coexist with computational thinking It is one of the major questions in humanities research today as scholars increasingly adopt sophisticated data science for their work James E Dobson explores the opportunities and complications faced by humanists in this new era Though the study and interpretation of texts alongside sophisticated computational tools can serve scholarship these methods cannot replace existing frameworks As Dobson shows ideas of scientific validity cannot easily nor should be adapted for humanities research because digital humanities unlike science lack a leading edge horizon charting the frontiers of inquiry Instead the methods of digital humanities require a constant rereading At the same time suspicious and critical readings of digital methodologies make it unwise for scholars to defer to computational methods Humanists must examine the tools including the assumptions that went into the codes and algorithms and questions surrounding their own use of digital technology in research Insightful and forward thinking Critical Digital Humanities lays out a new path of humanistic inquiry that merges critical theory and computational science

Operating Systems Raymond W. Turner, 1986. **Real Time Programming 1998 (WRTP '98)** Lichen Zhang, A. H. Frigeri, Liangchi Zhang, Wolfgang A. Halang, 1998. With its tradition of more than three decades, the IFAC/IFIP Workshop on Real Time Programming (WRTP) has become an excellent forum for exchanging information on recent technological advances and practices in real-time computing, a field that is becoming an essential enabling discipline of both control engineering and computer science and engineering. As there is an accelerated growth of demands for the functionality and dependability of real-time systems, our intellectual and engineering abilities are being challenged to come up with practical solutions to the problems faced in the design and development of complex real-time systems. The Workshop on Real Time Programming provides an opportunity to assess the state of the art, to present new results, and to discuss possible lines of future developments. Primarily, it focuses on software development for real-time systems and real-time operating systems. This 1998 Workshop covered the latest research and developments in real-time communication and formal specification, operating systems, and performance analysis, scheduling, use of neural networks in real-time systems, embedded systems, and programming methodologies. Contributions came from Europe, North America, Australia, and the Far East. In

addition to these high quality technical papers the programme also featured three world renowned keynote speakers

Restructuring Symbolic Programs for Concurrent Execution on Multiprocessors James R. Larus, 1989 CURARE the program restructurer described in this dissertation automatically transforms a sequential Lisp program into an equivalent concurrent program that executes on a multiprocessor CURARE first analyzes a program to find its control and data dependences This analysis is most difficult for references to structures connected by pointers CURARE uses a new data dependence algorithm which finds and classifies these dependencies The analysis is conservative and may detect conflicts that do not arise in practice A programmer can temper and refine its results with declarations Dependences constrain the program's concurrent execution because in general two conflicting statements cannot execute in a different order without affecting the program's result A restructurer must know all dependences in order to preserve them However not all dependences are essential to produce the program's result CURARE attempts to transform the program so it computes its result with fewer conflicts An optimized program will execute with less synchronization and more concurrency CURARE then examines loops in a program to find those that are unconstrained or lightly constrained by dependences By necessity CURARE treats recursive functions as loops and does not limit itself to explicit program loops Recursive functions offer several advantages over explicit loops since they provide a convenient framework for inserting locks and handling the dynamic behaviour of symbolic programs Loops that are suitable for concurrent execution are changed to execute on a set of concurrent server processes These servers execute single loop iterations and therefore need to be extremely inexpensive to invoke Restructured programs execute significantly faster than the original sequential programs This improvement is large

enough to attract programmers to a multiprocessor particularly since it requires little effort on their part Although restructured programs may not make optimal use of a multiprocessor s parallelism they make good use of a programmer s time
