Abstract

Polyethylene terephthalate, commonly coded as PET, PETE, is a thermoplastic polymer resin of the polyesters and is used in liquid containers, drinks, food and synthetic fibres. Depending on its processing and thermal conditions, PET may exist both as amorphous and as semi-crystalline. PET may appear opaque, white and transparent depending on its crystalline and amorphous structure. Its crystallinity and consequently its physical and mechanical properties are highly dependent on processing conditions like processing temperature, cooling rate, stretching process etc. In this study, it was tried to summarize all about PET crystallization by referring to all studies carried out before. Crystallization is very significant properties affecting all mechanical and physical properties of PET just as for all kind of polymers. As a result, this subject has taken in very good interest so far and it is believed that this interest will go on increasingly.

Özet

Polyethylene terephthalate, PET veya PETE şeklinde kısaltması yapılan, sıvıların, yiyecek ve içeceklerin saklanması ve taşınmasında, sentetik liflerin yapımında kullanılan polyester sınıfından termoplastik polimer bir reçinedir. Termal ve proses şartlarına bağlı olarak, PET amorf ya da semi-kristal yapıda olabilir. Bu özelliğinden dolayı PET donuk, beyaz ya da camı bir yapıda olabilir. PET'in kristal yapısı, buna bağlı olarak da fiziksel ve mekaniksel özellikleri büyük oranda işlem sıcaklığı, soğutma hızı, gerdirme işlemi gibi proses parametrelerine bağlıdır. Bu çalışmada, PET'nin kristalizasyonu ile ilgili daha önce yapılan bütün çalışmalar özetlenmeye çalışılmıştır. Tıpkı bütün polimerlerde olduğu gibi kristalizasyon PET'nin bütün fiziksel ve

Technical Conference, 1993 **10th ESAFORM Conference on Material Forming** Elías Cueto, Francisco Chinesta, 2007-05-10 This book contains papers presented at the 10th Annual ESAFORM Conference which covers the multitude of disciplines related to material forming This year s conference features for the first time an ECCOMAS Thematic conference devoted to new advanced numerical strategies in forming simulation which has been traditionally one of the mini symposia of the conference Material Characterization and Modeling of Strain Induced Crystallization in PET Above the Glass Transition Temperature Gurucharan Chandrasekaran, 2008 Abstract PET is a thermoplastic polymer that is extensively used in the production of packaging material for applications such as drawn fibers bottles and stretched films Its industrial applicability is largely based on the fact that it undergoes strain induced crystallization on deformation just above its glass transition temperature T_g Crystallization imparts increased density stiffness dimensional stability and resistance to permeability However the crystallization process and the mechanical behavior of PET above its T_g is highly dependent on factors such as temperature strain rate and the mode of deformation This makes it necessary to have a reliable material model that can be used in FEM simulations to predict its mechanical behavior This thesis is aimed at achieving two goals i to mechanically characterize three PET PCT blends that have not been previously tested PET00 PET1 5 and PET12 and to do a comparative study of the five PET PCT blends This was done by testing five PET PCT blends over a range of temperatures and strain rates in uniaxial compression and plane strain compression modes ii to modify the Dupaix Krishnan constitutive model to predict the occurrence and effects of strain induced crystallization in PET This involved testing PET and PETG under load hold conditions to identify the criteria that induce crystallization in PET Subsequently the material model was modified by incorporating these criteria Monotonic tests were conducted for the five PET PCT blends PET00 PET1 5 PET3 5 PET12 and PETG at temperatures of 90C and 100C and strain rates of 0 1 s 0 05 s and 0 005 s in uniaxial compression and plane strain compression The experimental results were then fit to the Dupaix Boyce constitutive model for these five blends The model was able to successfully capture the dependence of the material behavior on temperature strain rate and strain state above T_g for the five materials The experimental results were also useful in making a comparison of the mechanical behavior of the five materials to each other This showed that the behavior of the low PCT content materials were different from that of the high PCT content materials at conditions that favored crystallization Load hold experiments were conducted on PET00 PET3 5 and PETG at temperatures of 90C and 100C and strain rates of 0 1 s and 0 005 s in both uniaxial and plane strain compression The results obtained were

similar to that of the monotonic tests as they showed that while PET00 and PET3 5 crystallized at certain favorable conditions PETG did not Therefore it was found that the load hold condition was not one of the factors that lead to crystallization Crystallization occurred in PET only when all of the following conditions were met i high strain rates of 0.1 s⁻¹ and above ii temperatures of 90C-100C iii plane strain compression and iv after a certain amount of deformation Based on these findings changes were made to the Dupaix Krishnan material model to improve its ability to predict the occurrence and effects of strain induced crystallization on the large strain deformation behavior of PET near T_g
