**Secure OFDM System Design for Wireless Communications** Hao Li, 2013 Wireless communications is widely employed in modern society and plays an increasingly important role in people's daily life The broadcast nature of radio propagation however causes wireless communications particularly vulnerable to malicious attacks and leads to critical challenges in securing the wireless transmission Motivated by the insufficiency of traditional approaches to secure wireless communications physical layer security that is emerging as a

complement to the traditional upper layer security mechanisms is investigated in this dissertation Five novel techniques toward the physical layer security of wireless communications are proposed The first two techniques focus on the security risk assessment in wireless networks to enable a situation awareness based transmission protection The third and fourth techniques utilize wireless medium characteristics to enhance the built in security of wireless communication systems so as to prevent passive eavesdropping The last technique provides an embedded confidential signaling link for secure transmitter receiver interaction in OFDM systems In order to effectively and efficiently defend against malicious attacks in a wire less network the transmission nodes need to understand the communication risk in the operating environment A security level awareness scheme is proposed in this dissertation where the number of active users in a multipath fading environment is estimated A time domain pilot correlation TDPC algorithm for detecting OFDM signals with frequency domain inserted pilots is proposed to recognize the presence of active users based on the cyclic correlation between the complex conjugate multiplication of received signal segments and a local time domain pilot reference Taking advantage of a typical device fingerprint I Q imbalance the number of active users is estimated through counting all the identi ed distinct transmitter I Q imbalances With regard to enhancing the built in security of wireless communication systems against passive eavesdropping two novel anti eavesdropping OFDM systems are proposed by exploiting the reciprocal location dependent and time varying nature of wireless channels Based on the instantaneous channel state information CSI between the transmitter and legitimate receiver dynamic coordinate interleaving and subcarrier interleaving are employed in the two proposed secure OFDM systems respectively In the coordinate interleaving scheme a transmitter performs coordinate interleaving at partial subcarriers of each OFDM signal where the symbol coordinate of an OFDM subcarrier is interleaved in an opportunistic manner depending on the associated subcarrier channel gain or phase The subcarrier interleaving strategy is realized by interleaving subcarriers of each OFDM signal according to the sorted order of their sub channel gains Since wireless channels associated with each pair of users at separate locations exhibit independent multipath fading the frequently renewed security design can only be shared between legitimate users based on channel reciprocity Consequently eavesdropping is prevented due to mismatched information recovery at the eavesdropper In the final part of the dissertation the proposed anti eavesdropping OFDM systems are upgraded by enabling an efficient and confidential side information transmission mechanism between the legitimate users without interrupting the data transmission and requiring additional time and frequency resources In the design the cyclic prefix of an OFDM signal is replaced by a specially tailored orthogonal sequence The side information is conveyed by the confidential orthogonal sequence that maintains the same time and frequency characteristics as the data carrying OFDM symbol
