

Chemical Reaction Engineering

The rate of a reaction r_A

Since chemical reaction engineering concerns itself with the kinetics of the reaction, we must first define what is meant by the "rate of a reaction".

We define the rate of a reaction for component A as follows: "the amount of moles of A disappearing or being generated per unit time per unit volume is the rate of the reaction, denoted as r_A ".

Equation for Rate

The rate of a reaction is determined by the rate law. For example, for the reaction,

The rate law could look like,

$$-r_A = k[A]$$

Here, $[A]$ means the concentration of A in mol/L. We will use C_A to denote the concentration from now on. So,

$$-r_A = kC_A$$

In this case we say that the reaction is **first order in A**, as the exponent of C_A is 1. The rate law could also look like,

$$-r_A = kC_A^2$$

In this case, the reaction would be second order in A.

The rate law could also look something like this,

$$-r_A = \frac{k_1 C_A}{1 + k_2 C_A}$$

In which case the order would be hard to determine.

Rate for components of a reaction

Given the reaction,

The rate laws for each component are related as,

$$\frac{1}{a} r_A = \frac{1}{b} r_B = \frac{1}{c} r_C = \frac{1}{d} r_D$$

General Mole Balance for a System / Reactor

We now consider a system volume with a species j as shown below:

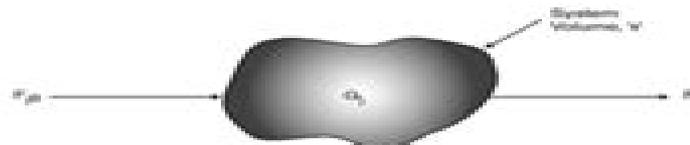

Figure 1-5 : Mole balance on species j in a system volume, V

The mole balance on this system is,

$$\begin{aligned} & \text{[moles of } j \text{ in per unit time]} - \text{[moles of } j \text{ out per unit time]} + \text{[moles of } j \text{ generated per unit time]} \\ & = \text{[moles of } j \text{ accumulated per unit time]} \end{aligned}$$

$$F_{j0} - F_j + G_j = \frac{dN_j}{dt}$$

If all the properties of a system, such as catalysis concentration, temperature, concentration of species are uniform throughout the volume, then we can write the G_j terms simply as the product of r_j and the system volume V .

$$F_{j0} - F_j + r_j V = \frac{dN_j}{dt}$$

Reaction Engineering Octave Levenspiel, 1998-09-01 Chemical reaction engineering is concerned with the exploitation of chemical reactions on a commercial scale. Its goal is the successful design and operation of chemical reactors. This text emphasizes qualitative arguments, simple design methods, graphical procedures, and frequent comparison of capabilities of the major reactor types. Simple ideas are treated first and are then extended to the more complex. **Control of Polymerization Reactors** Joseph Schork, 2017-09-20 This reference and text provides an in-depth description of developments in control techniques and their application to polymerization reactors and offers important introductory background information on polymerization reaction engineering. Discussing modelling, identification, linear, nonlinear, and multivariable schemes, *Control of Polymerization Reactors* presents all available techniques that can be used to control reactors properly for optimal performance, shows how to manipulate pivotal variables that affect reactor control, examines methods for deriving dynamic process models to improve reactor efficiency, reviews reactor control problems and points out end use properties, supplies methods for measuring process variables and ways to estimate variables that can't be measured, and explains how single input single output (SISO) strategies can be effectively used for control. Filled with illustrative examples to clarify concepts, including more than 730 figures, tables, and equations, *Control of Polymerization Reactors* is intended for use as a reference for chemical process development, process design, research, and development, control systems, and polymer engineers and polymer chemists and physicists, as well as a text for upper-level undergraduate and graduate students in polymerization reactor control courses.
