IEEE Standard for Communication-based Train Control (CBTC) Performance and Functional Requirements, 1999

Performance and functional requirements for a communications based train control CBTC system are established in this standard A CBTC system is a continuous automatic train control system utilizing high resolution train location determination independent of track circuits continuous high capacity bidirectional train to wayside data communications and trainborne and wayside processors capable of implementing automatic train protection ATP functions as well as optional automatic train operation ATO and automatic train supervision ATS functions

Communications-Based Train Control (CBTC) Lars Schnieder, 2015-03-17 Urban rail systems are increasingly reaching their limits as traffic demand rises The safety and performance of these transport systems are significantly determined by the control and safety technology used Expanding the transport offering requires efficient signaling systems known as Communications Based Train Control CBTC systems In this book the author presents the system environment into which CBTC systems are integrated within urban transport companies It shows how the individual safety functions of CBTC solutions contribute to hazard control and how technical systems progressively take over more functions from humans with increasing grades of automation Finally non functional requirements for CBTC systems such as safety availability performance and cost effectiveness are discussed and factors for the successful execution of complex signaling renewal projects are highlighted

Advances in Communications-Based Train Control Systems F. Richard Yu, 2015-11-05 With rapid population explosion improving rail transit speed and capacity is strongly desirable around the world Communication based train control CBTC is an automated train control system using high capacity bidirectional train ground communications to ensure the safe operation of rail vehicles This book presents the latest advances in CBTC

Communications-Based Train Control (CBTC) Lars Schnieder, 2019 Long description Millions of people use public transport every day Without efficient rail transport systems the world's metropolises would face a traffic infarction every day However in many places the existing infrastructure is reaching the limits of its capacity The key to increasing the efficiency of urban rail transport systems lies in automation In recent decades more and more cities around the world have invested in high performance rail transport systems For a long time Germany has not reinvested in metro and light rail systems The technological basis in cities is therefore often outdated and in some places has already exceeded the limits of its technical life In some cities transport companies will therefore renew their infrastructure over the next few years In Germany too comprehensive investments in the renewal of the signalling infrastructure of metro and light rail systems are to be expected This ABSTRACT represents the valid normative basis for highly automated light rail systems The presentation in this ABSTRACT is based on the author's experience in advising transport companies and his practical work in the acceptance assessment of train protection systems for international metros and light rail vehicles What you can take from this ABSTRACT Definitions of automatic train control systems CBTC Basic safety functions of automatic train control systems

Definition of the degree of automation of automatic train control systems Operating modes and mode transitions of automatic train control systems Performance criteria of automatic train control systems *On-Board Design Models and Algorithm for Communication Based Train Control and Tracking System* Tanuja Patgar, Kavitha Devi CS, 2022-05-30 Railway systems have a long history of train protection and control as to reduce the risk of train accidents Many train control systems include automated communication between train and trackside equipment But several different national systems are still facing cross border rail traffic Today trains for cross border traffic need to be equipped with train control systems that are installed on the tracks This book covers the latest advances in Communication Based Train Control CBTC research in on board components locomotive messaging systems GPS sensors communications wayside and switching networks It also focuses on architecture and methodology using data fusion techniques New wireless sensor integrated modeling techniques for tracking trains in satellite visible and low satellite visible environments are discussed With a Tunnel Surveillance Integration model the use of optimal control is necessary to improve train control performance considering both train ground communication and train control The book begins with the background and evolution of train signaling and train control systems It introduces the main features and architecture of CBTC systems and describes current challenging methods and successful implementations This introductory book is very useful for Signal Telecommunication engineers to get them acquainted with the technology used in CBTC and help them in implementing the system suitable for Indian Railways As this is a new technology the information provided in this book is generic and will be subsequently revised after gaining further experience

Standards for Communication Based Train Control Performance Requirements and Functional Requirements

IEEE, 2000-11-01 Performance and functional requirements for a communications based train control CBTC system are established in this standard A CBTC system is a continuous automatic train control system utilizing high resolution train location determination independent of track circuits continuous high capacity bidirectional train to wayside data communications and trainborne and wayside processors capable of implementing automatic train protection ATP functions as well as optional automatic train operation ATO and automatic train supervision ATS functions Secure Communications Based Train Control (CBTC) Operations Mark W. Hartong, 2009 Communications Based Train Control CBTC provides positive train separation over speed protection and protection for roadway workers Current system designs do not include trust management systems to provide support for security rendering CBTC communications vulnerable to malactors Traditional train control methods and the architecture of CBTC systems are studied to determine specific vulnerabilities of CBTC systems and the associated system security requirements The security requirements are then used to derive an appropriate trust management system Existing work on safe cross domain dispatch operations has not considered the impact of these trust management systems on allowable traffic delays and system velocity or related them to train dynamics A relationship between train dynamics and trust management delay is presented to allow engineering estimates of the practicality of

potential trust management systems to support rail operations while preventing collisions An algorithm for the safe and secure scheduling of trains through the interchange point between is provided The algorithm supports positive train separation under a worst case traffic scenario allowing for safe and secure scheduling while reducing traffic delays The approach presented is illustrated by an example and is independent of the specific security management CBTC and dispatch systems
