1.1: BASIC CONCEPT OF STRESS:

The use of terminology "Stress" in our daily conversation has increases. Though we all talk so much about stress but it often isn't clear what stress really is about all? We are well aware with some terms which are used synonymously for stress. These terms are stress, strain, conflict, burnout, depression and pressure.

Many people consider stress is something that happens to them, an event such as a harm or encouragement. Whereas others think stress is what happens to our bodies, psyche and our behaviour in response to an event. When something happens to us, we as a reflex action start evaluating the situation mentally. We try to come to a decision, if it is threatening to us, how we need to deal with the situation and what skills and strategies we can use. If we come to conclusions that the demands of the situation overshadow the skills we have, then we label the circumstances as "stressful" and need to react it with the classic "stress response". If we trust that our coping skills prevail over the demands of the situation, then we don't see it as "stressful". Some situations in life are stress-provoking, but they are our thoughts about situations that determine whether they are a problem to us or not. How we

Collective Phenomena in Plasmas and Elsewhere Kamel Ourabah, 2023-10-03 The Universe is made up of systems consisting of a very large number of particles interacting in a very complex way When studying these systems a precise microscopic approach is unattainable In practice the best strategy is one that is able to distinguish between superfluous information and the information needed to make predictions about the evolution of the system There are two main competing approaches kinetic and hydrodynamic Collective Phenomena in Plasmas and Elsewhere presents an overview of the theoretical bases of these kinetic and hydrodynamic approaches but also discusses their limitations the links between them

and their extension to quantum mechanics and relativity These methods were born in part out of the study of plasmas but they also have more universal applications A general framework for these approaches is outlined followed by some applications in plasmas gravitation Bose Einstein condensates and dark matter Particular emphasis is placed on the analogies that can be made between all these different systems
