

## Spatial Data Formats

The spatial data are represented in raster and vector data formats :

### Raster Data Format

Raster data represent a graphic feature as a pattern of grids of squares, whereas vector data represent the object as a set of lines drawn between specific points.

Consider a line drawn diagonally on a piece of paper. A raster file would represent this image by sub-dividing the paper into a matrix of small rectangles, similar to a sheet of graph paper called cells. Each cell is assigned a position in the data file and given a value based on the attribute at that position. Its row and column

coordinates may identify any individual pixel (Fig. 6.3). This data representation allows the user to easily reconstruct or visualise the original image.

The relationship between cell size and the number of cells is expressed as the **resolution** of the raster. The effect of grid size on data in raster format is explained in Fig. 6.4.
