

Cell Structure and Function

BIG PICTURE IDEAS

- Cells are the basic units of life and can be classified into two main types: **prokaryotic cells**, which lack a nucleus and membrane-bound organelles, and **eukaryotic cells**, which have a nucleus and various organelles.
- Organelles** are specialized structures within cells that perform specific functions. Examples include the **nucleus** (containing DNA), **mitochondria** (producing energy through cellular respiration), endoplasmic reticulum (involved in protein synthesis and lipid metabolism), and **Golgi apparatus** (modifying, sorting, and packaging proteins).
- Osmosis** is a type of passive transport in which water molecules move across a selectively permeable membrane from an area of lower solute concentration (**hypotonic**) to an area of higher solute concentration (**hypertonic**). It plays a vital role in maintaining proper water balance within cells and is crucial for various biological processes, including nutrient uptake and waste removal.
- Cellular **transport** is the process by which substances move into, out of, and within cells. It includes various mechanisms such as passive transport, facilitated diffusion, active transport, endocytosis, and exocytosis, ensuring the proper exchange of molecules and maintaining cellular **homeostasis**.
- The **plasma membrane** is a selectively permeable barrier that surrounds cells, regulating the entry and exit of substances. It consists of a phospholipid **bilayer** embedded with **proteins** and other molecules.
