An Introduction To Bicomponent Fibers Hills Inc:

Resorbable Fiber-Forming Polymers for Biotextile Applications Chirag R. Gajjar, Martin W. King, 2014-07-05 This book summarizes the properties and applications of conventional and commercially available fiber forming bioresorbable polymers as well as those currently under study for use as biotextiles Factors affecting the performance of these biomaterials are presented and precautionary measures to reduce premature hydrolytic degradation during manufacturing and processing are discussed Because of the structural requirements of medical devices and the technological advancements in synthetic fibers and textile technology the new field of Biotextiles has evolved to exploit the potential of various woven knitted braided and non woven textile structures for biomedical applications Textile substrates provide certain unique mechanical properties to the medical device and because of an inherently high level of porosity they can encourage cell growth and promote migration and proliferation Bioresorbable devices that assist in the repair and regeneration of damaged tissues have in recent years replaced many of the permanent prosthetic devices Thus the topic of Bioresorbable Biomaterials generates much interest and research activity in the field of biomaterials science today For this reason the use of bioresorbable polymers as fibers is currently dominating the field of resorbable biomaterials for applications from sutures to tissue engineering scaffolds

A.T.A. Journal

,2000 **Introduction to Nonwovens Technology** Subhash Kumar Batra, Behnam Pourdeyhimi, 2012 The processing of nonwovens depends on a range of technologies some adapted from the textile and paper industries others developed uniquely for nonwovens production The present volume provides a systematic step by step explanation of virtually all

processes that integrate relevant raw materials into finished nonwovens for different end uses In comprehensive terms the book explains the connection between the structure of nonwovens and the specialized as well as still evolving technologies used to produce them from simple roll goods to nanoscale webs and fiberwebs The unified treatment in the book is meant to serve the needs of engineering and technology students For students and instructors the text also offers reviews of basic chemistry polymer physics and heat transfer concepts which are linked to processing and design information Problems and exercises are presented for classroom study and individual practice The book can also be used profitably as a self teaching tool by professionals working in or new to the nonwovens industry From the Foreword by John Hearle In comparison with other publications the present book covers the great diversity of nonwovens and emphasizes how new types of nonwovens can be created through the use of novel fibres This approach integrates many aspects of fibres and textile structures that are not associated with the conventional forms of nonwovens which were established over the last fifty years In this sense the book summarizes existing technical knowledge and suggests ways of going beyond it
