Akl, 2014-06-20 Parallel Sorting Algorithms explains how to use parallel algorithms to sort a sequence of items on a variety of parallel

computers The book reviews the sorting problem the parallel models of computation parallel algorithms and the lower bounds on the parallel sorting problems The text also presents twenty different algorithms such as linear arrays mesh connected computers cube connected computers Another example where algorithm can be applied is on the shared memory SIMD single instruction stream multiple data stream computers in which the whole sequence to be sorted can fit in the respective primary memories of the computers random access memory or in a single shared memory SIMD processors communicate through an interconnection network or the processors communicate through a common and shared memory The text also investigates the case of external sorting in which the sequence to be sorted is bigger than the available primary memory In this case the algorithms used in external sorting is very similar to those used to describe internal sorting that is when the sequence can fit in the primary memory The book explains that an algorithm can reach its optimum possible operating time for sorting when it is running on a particular set of architecture depending on a constant multiplicative factor The text is suitable for computer engineers and scientists interested in parallel algorithms

On Batcher's Merge Sorts as Parallel Sorting Algorithms Christine Rüb,1997 Abstract In this paper we examine the average running times of Batcher's bitonic merge and Batcher's odd even merge when they are used as parallel merging algorithms It has been shown previously that the running time of odd even merge can be upper bounded by a function of the maximal rank difference for elements in the two input sequences Here we give an almost matching lower bound for odd even merge as well as a similar upper bound for a special version of bitonic merge From this follows that the average running time of odd even merge bitonic merge is formula where n is the size of the input and p is the number of processors used Using these results we then show that the average running times of odd even merge sort and bitonic merge sort are formula that is the two algorithms are optimal on the average if formula The derived bounds do not allow to compare the two sorting algorithms directly thus we also present experimental results obtained by a simulation program for various sizes of input and numbers of processors
