Mechcomp3 Antonio J.M. Ferreira, Erasmo Viola, Francesco Tornabene, Nicholas Fantuzzi, 2017-05-25 The use of composite materials has grown exponentially in the last decades and has affected many engineering fields due to their enhanced mechanical properties and improved features with respect to conventional materials For instance they are employed in civil engineering seismic isolators long span bridges vaults mechanical engineering turbines machine components aerospace and naval engineering fuselages boat hulls and sails automotive engineering car bodies tires and biomechanical engineering prostheses Nevertheless the greater use of composites requires a rapid progress in gaining the needed knowledge to design and manufacture composite structures Thus researchers and designers devote their own efforts to develop new analysis techniques design methodologies manufacturing procedures micromechanics approaches theoretical models and numerical methods For these purpose it is extremely easy to find many recent journal papers books and technical notes focused on the mechanics of composites In particular several studies are presented to take advantage of their superior features by varying some typical structural parameters such as geometry fiber orientations volume fraction structural stiffness weight lamination scheme Therefore this Conference aims to collect contributions from every part of the globe that can increase the knowledge of composite materials and their applications by engaging researches and professional engineers and designers from different sectors The same aims and scopes have been reached by the previous editions of Mechanics of Composites International Conferences MECHCOMP which occurred in 2014 at Stony Brook University USA and in 2016 at University of Porto Portugal
