**Adaptation and Hybridization in Computational Intelligence** Iztok Fister,Iztok Fister Jr.,2015-01-24 This carefully edited book takes a walk through recent advances in adaptation and hybridization in the Computational Intelligence CI domain It consists of ten chapters that are divided into three parts The first part illustrates background information and provides some theoretical foundation tackling the CI domain the second part deals with the adaptation in CI algorithms while the third part focuses on the hybridization in CI This book can serve as an ideal reference for researchers and students of computer science electrical and civil engineering economy and natural sciences that are confronted with solving the optimization modeling and simulation problems It covers the recent advances in CI that encompass Nature inspired algorithms like Artificial Neural networks Evolutionary Algorithms and Swarm Intelligence based algorithms **Input Modeling with Phase-Type Distributions and Markov Models** Peter Buchholz,Jan Kriege,Iryna Felko,2014-05-20 Containing a summary of several recent results on Markov based input modeling in a coherent notation this book introduces and compares algorithms for parameter fitting and gives an overview of available software tools in the area Due to progress made in recent years with respect to new algorithms to generate PH distributions and Markovian arrival processes from

measured data the models outlined are useful alternatives to other distributions or stochastic processes used for input modeling Graduate students and researchers in applied probability operations research and computer science along with practitioners using simulation or analytical models for performance analysis and capacity planning will find the unified notation and up to date results presented useful Input modeling is the key step in model based system analysis to adequately describe the load of a system using stochastic models The goal of input modeling is to find a stochastic model to describe a sequence of measurements from a real system to model for example the inter arrival times of packets in a computer network or failure times of components in a manufacturing plant Typical application areas are performance and dependability analysis of computer systems communication networks logistics or manufacturing systems but also the analysis of biological or chemical reaction networks and similar problems Often the measured values have a high variability and are correlated It s been known for a long time that Markov based models like phase type distributions or Markovian arrival processes are very general and allow one to capture even complex behaviors However the parameterization of these models results often in a complex and non linear optimization problem Only recently several new results about the modeling capabilities of Markov based models and algorithms to fit the parameters of those models have been published

Swamidass,2006-09-21 The Encyclopedia of Production and Manufacturing

Management is an encyclopedia that has been developed to serve this field as the fundamental reference work. Over the past twenty years the field of production and operations management has grown more rapidly than ever and consequently its boundaries have been stretched in all directions. For example in the last two decades production and manufacturing management absorbed in rapid succession several new production management concepts: manufacturing strategy, focused factory, just in time manufacturing, concurrent engineering, total quality management, supply chain management, flexible manufacturing systems, lean production, and mass customization to name a few. This explosive growth makes the need for this volume abundantly clear. The manufacturing industry thinks and acts more broadly than it did several decades ago. The most notable change has been the need for manufacturing managers to think in technological, strategic, and competitive terms. This is a very favorable development and it leads to manufacturing success. The entries in this encyclopedia include the most recent technical and strategic innovations in production and manufacturing management. The encyclopedia consists of articles of varying lengths. The longer articles on important concepts and practices range from five to fifteen pages. There are about 100 such articles written by nearly 100 authors from around the world. In addition there are over 1000 shorter entries on concepts, practices, and principles. The range of topics and depth of coverage is intended to suit both student and professional audiences. The shorter entries provide digests of unfamiliar and complicated subjects. Difficult subjects are made intelligible to the reader without oversimplification. The strategic and technological perspectives on various topics give this Encyclopedia its distinctiveness and uniqueness. The world of manufacturing today is increasingly competitive. It is apparent that manufacturers must respond to these competitive pressures with technical and strategic innovation. This encyclopedia has been developed to help researchers, students, and those in the manufacturing industry to understand and implement these ongoing changes in the field.
