## **Annular Variability And Eddy Zonal Flow Interactions In A:**

**Modified Lagrangian-Mean Perspective of Annular Mode Variability** David Burrows, 2014 The leading mode of extratropical variability or annular mode is characterized as a meridional seesaw of mass between middle and high latitudes or equivalently a barotropic dipole in the zonal wind anomaly field With an understanding of the spatial structure of the annular mode variability focus has shifted to the eddy zonal flow interaction or Rossby wave breaking that leads to the persistence of the zonal wind anomalies Much insight has been gained from the conventional relationship between the zonal mean flow and eddy fluxes and the resulting mechanisms often involve eddies of different frequencies or barotropic versus baroclinic processes Here a new perspective of the annular mode variability is presented in the Modified Lagrangian Mean MLM formalism of a quasi geostrophic QG and absolute vorticity model By applying the MLM to the QG potential vorticity PV tendency budget a closure equation for annular mode variability or eddy vorticity flux can be obtained The eddy vorticity flux closure model can be described by a simple diffusive equation with the eddy fluxes absorbed in the MLM A similar diffusive equation is obtained using absolute vorticity but with a redefinition of the wave type and wave source Instead of a QG PV baroclinic wave source absolute vorticity provides a horizontally divergent source of waves which are important for wave propagation wave breaking and annular mode variability These formalisms are applied to a baroclinic eddy lifecycle and annular mode variability in an idealized model It is shown that the shift of a zonal jet during an eddy life cycle can be attributed to horizontal wave tendency whereas its persistence is concurrent with small scale dissipation associated with Rossby wave breaking Furthermore analysis of annular modes in the idealized model suggests that the wave activity associated with the annular mode variability is short lived and that the persistence of the annular mode may be attributed to the eddy source and diffusion of the eddy vorticity flux also associated with Rossby wave breaking

**The North Atlantic Oscillation** James W. Hurrell, 2003-01-10 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 134 Over the middle and high latitudes of the Northern Hemisphere the most prominent and recurrent pattern of atmospheric variability is the North Atlantic Oscillation NAO The NAO refers to swings in the atmospheric sea level pressure difference between the Arctic and the subtropical Atlantic that are most noticeable during the boreal cold season November April and are associated with changes in the mean wind speed and direction Such changes alter the seasonal mean heat and moisture transport between the Atlantic and the neighboring continents as well as the intensity and number of storms their paths and their weather Significant changes in ocean surface temperature and heat content ocean currents and their related heat transport and sea ice cover in the Arctic and sub Arctic regions are also induced by changes in the NAO Such climatic fluctuations affect agricultural harvests water management energy supply and demand and fisheries yields All these effects have led to many studies of the phenomenon yet despite this interest unanswered questions remain regarding the climatic processes that govern NAO variability how the phenomenon has varied

in the past or will vary in the future and whether it is at all predictable

Stratosphere Troposphere Interactions K. Mohanakumar, 2008-07-03 Stratospheric processes play a significant role in regulating the weather and climate of the Earth system Solar radiation which is the primary source of energy for the tropospheric weather systems is absorbed by ozone when it passes through the stratosphere thereby modulating the solar forcing energy reaching into the troposphere The concentrations of the radiatively sensitive greenhouse gases present in the lower atmosphere such as water vapor carbon dioxide and ozone control the radiation balance of the atmosphere by the two way interaction between the stratosphere and troposphere The stratosphere is the transition region which interacts with the weather systems in the lower atmosphere and the richly ionized upper atmosphere Therefore this part of the atmosphere provides a long list of challenging scientific problems of basic nature involving its thermal structure energetics composition dynamics chemistry and modeling The lower stratosphere is very much linked dynamically radiatively and chemically with the upper troposphere even though the temperature characteristics of these regions are different The stratosphere is a region of high stability rich in ozone and poor in water vapor and temperature increases with altitude The lower stratospheric ozone absorbs the harmful ultraviolet UV radiation from the sun and protects life on the Earth On the other hand the troposphere has high concentrations of water vapor is low in ozone and temperature decreases with altitude The convective activity is more in the troposphere than in the stratosphere
