

AP Statistics Ch 4 Review Answers

1. An outlier is a point that falls outside the normal pattern of the data.
2. Causation is when a variable x CAUSES variable y . $x \rightarrow y$
 Common Response is when both variables x and y are responding to a lurking variable z and x and y are NOT related
 Confounding with when x and y are related BUT there is a lurking variable z that is also affecting y . Therefore, how x affects y is CONFOUNDED by z .
3. If the LSRL of $\log x$ and $\log y$ yields a correlation near 1, this reveals that $\log x$ and $\log y$ most likely have a linear relationship, and x and y have a curved, or nonlinear, or power relationship.
4. Dangers of regression: outliers, must have an explanatory response relationship, always look at your graph first- only do a linear regression if the data looks linear.
5. Regression/Prediction requires an explanatory response relationship
6. Correlation: Since -0.7 is fairly close to -1 , there is a negative, moderately strong, linear relationship between x and y .
 Coefficient of determination: About 49% of the variation in y can be explained by the LSRL of y on x .
