

CHAPTER 1

ZOOLOGY:

AN EVOLUTIONARY AND ECOLOGICAL PERSPECTIVE

Outline

- Zoology: An Evolutionary Perspective
 - Evolutionary Processes
 - Animal Classification and Evolutionary Relationships
- Zoology: An Ecological Perspective
 - World Resources and Endangered Animals

Concepts

- The field of zoology is the study of animals. It is a very broad field with many subdisciplines.
- An understanding of evolutionary processes is very important in zoology because evolution explains the family relationships among animals and how the great variety of animals arose.
- An understanding of ecological principles is very important in zoology because it helps zoologists to understand the interrelationships among individual animals and groups of animals. Understanding ecological principles also helps zoologists to understand how human interference threatens animal populations and the human environment.

Zoology (*Zo-*, *zōon*, + *logos*, to study) is the study of animals. It is one of the broadest fields in all of science because of the immense variety of animals and the complexity of the processes occurring within animals. There are, for example, over 20,000 described species of bony fishes and over 500,000 described (and many more undescribed) species of beetles! It is no wonder that zoologists usually specialize in one or more of the subdisciplines of zoology. They may study particular functional, structural, or ecological aspects of one or more animal groups (table 1.1), or they may choose to specialize in a particular group of animals (table 1.2).

Ichthyology, for example, is the study of fishes, and ichthyologists work to understand the structure, function, ecology, and evolution of fishes. These studies have uncovered an amazing diversity of fishes. One large group, the cichlids, is found in Africa (1,000 species), Central and South America (300 species), India (3 species) and North America (1 species). Members of this group have an enormous variety of color patterns (figure 1.13), habitats, and body forms. Ichthyologists have described a wide variety of feeding habits in cichlids. These fish include algae scrapers, like *Evromodus*, that nip algae with chisel-like teeth; insect pickers, like *Tanganicodus*; and scale eaters, like *Perissodus*. All cichlids have two pairs of jaws. The mouth jaws are used for scraping or ripping food, and the throat jaws are used for crushing or macerating food before it is swallowed.

Many cichlids mouth brood their young. A female takes eggs into her mouth after the eggs are spawned. She then incubates sperm released by the male, and fertilization and development take place within the female's mouth! Even after the eggs hatch, young are taken back into the mouth of the female if danger threatens (figure 1.17). Hundreds of variations in color pattern, body form, and behavior in this family of fishes illustrate the remarkable diversity present in one relatively small branch of the animal kingdom. Zoologists are working around the world to understand and preserve the enormous diversity.

This chapter contains evolutionary concepts, which are set off in this font.
