Process Control in Rotor Spinning R. Senthilkumar, 2016-05-20 Open end spinning is a process in which fibrous material is highly drafted ideally to the individual fiber state creating a break in the continuum of the fiber mass The individual fibers are subsequently collected onto the open end of a yarn that is rotated to twist the fibers into the yarn structure to form a continuous yarn length Rotor spinning usually referred to as open end spinning was commercially introduced during the late 1960s and is second only to ring spinning in terms of short staple yarn production The rotor spinning machine is fed with draw frame sliver which transform the yarn directly into packages eliminating the roving process With this spinning method twisting and package building are separated by employing the false twist principle The first rotor spinning machine suitable for industrial use was presented in 1967 with the name BD200 in ITMA exhibition The current share of rotor spun yarn is around 20% of total staple fiber yarn production and it is increasing steadily

Process Management in Spinning R. Senthil Kumar, 2014-09-23 A Straightforward Text Summarizing All Aspects of Process Control Textile manufacturing is one of the largest industries in the world second only to agriculture Spinning covers a prominent segment in textile manufacturing and this budding industry continues to thrive and grow Process Management in Spinning considers aspect of process management and offers insight into the process control procedures and methods of spinning Focusing on the technology as well as the management of the process it examines both the economic and technological advancements currently taking place in the spinning industry This text takes a close look at the advancing technology in manufacturing and process and product quality control It provides a basic overview of the subject and also presents applications of this technology for practicing engineers Incorporates Industry Based Real World Examples The book contains 15 chapters that specifically address the stages of process control energy management methods humidification and ventilation systems basics pollution management process management tools productivity waste control material handling and other aspects of spinning mills It also includes real time case studies involving typical problems that arise in spinning processes and strategies used to contain them The author provides a broad outlook on various topics including mixing winding raw material and optimizing raw material properties bale management yarn engineering systems processing and process management systems He also details the defects associated with each and every process with causes effects and control measures The book addresses process management as it relates to productivity quality and costs as well as process control as it relates to man machine and material Provides the scientific method for optimization optimizing the properties of

the fibers Familiarizes the reader with remedial measures to enhance the quality of the product Addresses productivity measurement and its role in controlling the cost of the manufacturing process Contains detailed examples as well as linear programming and optimization techniques and statistical applications Covers the areas of process control methods in spinning defect analysis and rectification improving productivity and quality and using statistical tools Process Management in Spinning establishes the various process management measures required to help improve the process efficiency in spinning mills and the textile industry overall Aimed at professionals in the textile industry this text is a perfect resource for textile engineers technologists manufacturers spin quality control engineers spin quality assurance personnel and other industry professionals

Process Control in Ring Spinning R. Senthilkumar,2016-05-19 Spinning is the process of producing continuous twisted strands yarn of a desired size from fibrous materials Spinning can be categorized based on staple length as long staple spinning and short staple spinning Short staple spinning machines process fibres such as cotton polyester viscose and its blends thereof The yarn formation is usually accomplished by any one of the spinning systems Spinning systems presently employed include ring rotor self twist friction air jet twistless and wrap spinning with the first mentioned two systems by far the most important for cotton spinning together accounting for far over 90% of the cotton yarn produced globally The ring spinning invented by John Thorpe in 1830 has been very successful in producing yarns from staple fibres Since its inception ring spinning had remained unchallenged for almost 150 years Ring spinning accounts for some 75% of global long and short staple yarn production The main reason attributed for the success of ring spinning over other spinning systems is the superior quality notably strength and evenness of ring spun yarns over those produced by other systems

Process Control in Winding R. Senthilkumar,2016-05-20 Yarn winding is the final stage of the yarn forming process and the starting point for various subsequent processes from weaving or knitting to textile finishing Yarns manufactured and packaged from ring spinning are not in the optimum condition to be used to form fabrics Package size build and other factors make it necessary for the yarn to be further processed to prepare it to be handled efficiently during fabric formation Yarn winding can be viewed as a packaging process forming a link between the last few elements of yarn manufacturing and the first element of fabric manufacturing process This interface function of winding is what makes the winding process so important

Senthilkumar,2016-05-19 The main tasks of blow room process are opening cleaning and blending of cotton fiber tufts without over stressing of fibers One important function of the blow room is to disintegrate the fiber bales into a flow of very small clumps of fiber which are sufficiently small in size to be digested by the cards The intensity of fiber treatment is different because the tufts continually become smaller as they pass from stage to stage Cotton bale have non lint content apart from cotton that have to be removed in the initial stages of spinning process itself About 40% to 70% trash is removed in blow room section Blender equipped in the blow room sequence reduces the lot to lot variability existing in the raw material by homogenous blending A Manual on Quality Control in Spinning Tarakad Vedamurthy Ratnam,G.
