### ABSTRACT

The present investigation regarding study of genetic variation of 19 genotypes of tomato (*Solanum lycopersicum* L.) started with the screening of polymorphic microsatellite markers. From the identified 11 polymorphic SSR markers, a total of 261 polymorphic amplified fragments were obtained. The average polymorphism information content (PIC) was 0.990 ranging from 0.979 (SSR-110) to 0.995 (SSR-253). Two hundred sixty one SSR loci were used to calculate Jaccard's distance coefficients for UPGMA cluster analysis. The generated dendrogram of 19 tomato genotypes showed low level of similarity among these genotypes. Two major clusters were generated at 43% level of similarity. The cluster A consists of two genotypes whereas cluster B consist of rest of 17 genotypes. The results also showed that the genotypes Arka Vikas and 2012TODVAR-2 were 100% similar. Therefore, these markers may be used for wide range of practical application including varietal identification and pre-screening for distinctiveness of tomato genotypes.

### Introduction

Tomato (*Solanum lycopersicum* L.;  $2n=24$ ) is one of the main vegetable crops worldwide next to potato because of its wider adaptability, high yielding potential and multipurpose uses. It contributes both pro-vitamin A and vitamin C to the human diet and providing high economic value to producers and breeding industries in many countries (Todorovska *et al.*, 2014; He *et al.*, 2003).

Deoxyribonucleic acid (DNA) polymorphisms provide a powerful tool for quantifying the existing levels of genetic variation in plant germplasm, either cereals or vegetables. Molecular markers can provide an effective tool for efficient selection of desired

agronomic traits. Molecular markers such as restriction fragment length polymorphism (RFLP), random amplified polymorphic DNA (RAPD), amplified fragment length polymorphism (AFLP), and simple sequence repeats (SSR) can provide an effective tool for variety identification since they are independent of environmental variation (Lee and Henry, 2001). Among the different available marker systems, SSR markers have become an important marker system for variety identification. The main advantage of SSRs is their co-dominant type of inheritance. With co-dominant markers, heterozygous individuals can be easily distinguished from homozygous, allowing the determination of allele configuration of each genotype and allele frequencies at
