## Embedded System Interview Questions with Answers

**Q1. What is an embedded system? Give an example.**

**Answer:** An embedded system is a computer system designed to perform a dedicated function within a larger system. It is often found in consumer electronics, industrial machinery, and automotive systems. Example: A digital watch.

**Q2. What is the difference between a microcontroller and a microprocessor?**

**Answer:** A microcontroller is a single-chip device that contains the processor, memory, and peripheral devices. A microprocessor is a single-chip device that contains only the processor. Example: An 8051 microcontroller vs. an Intel 80486 microprocessor.

**Q3. What is the role of an operating system in an embedded system?**

**Answer:** An operating system (OS) manages the hardware resources of the system and provides a layer of abstraction for the application software. It handles tasks such as memory management, process scheduling, and device control. Example: Real-time OS like VxWorks.

**Q4. What is real-time processing? Give an example.**

**Answer:** Real-time processing is a type of computer processing where the system must respond to external events within a strict time constraint. Example: A traffic light control system.

Riedel,1997-04-30 Knowledge based systems are increasingly found in a wide variety of settings and this handbook has been written to meet a specific need in their widening

use While there have been many successful applications of knowledge based systems some applications have failed because they never received the corrective feedback that evaluation provides for keeping development focused on the users needs in their actual working environment This handbook provides a conceptual framework and compendium of methods for performing evaluations of knowledge based systems during their development Its focus is on the users and subject matter experts evaluation of the usefulness of the system and not on the developers testing of the adequacy of the programming code The handbook permits evaluators to systematically answer the following kinds of questions Does the knowledge based system meet the users task requirements Is the system easy to use Is the knowledge base logically consistent Does it meet the required level of expertise Does the system improve performance The authors have produced a handbook that will serve two audiences a tool that can be used to create knowledge based systems practitioners developers and evaluators and a framework that will stimulate more research in the area academic researchers and students To accomplish this the handbook is built around a conceptual framework that integrates the different types of evaluations into the system of development process The kinds of questions that can be answered and the methods available for answering them will change throughout the system development life cycle And throughout this process one needs to know what can be done and what can t It is this dichotomy that addresses needs in both the practitioner and academic research audiences
