**Processors** Manish Verma,Peter Marwedel,2007-06-20 In a relatively short span of time computers have evolved from huge mainframes to small and elegant desktop computers and now to low power ultra portable handheld devices

With each passing generation computers consisting of processors memories and peripherals became smaller and faster For example the rst commercial computer UNIVAC I costed 1 million dollars occupied 943 cubic feet space and could perform 1 905 operations per second 94 Now a processor present in an electric shaver easily outperforms the early mainframe computers The miniaturization is largely due to the efforts of engineers and scientists that made the expeditious progress in the microelectronic technologies possible According to Moore s Law 90 the advances in technology allow us to double the

number of transistors on a single silicon chip every 18 months This has led to an exponential increase in the number of transistors on a chip from 2 300 in an Intel 4004 to 42 millions in Intel Itanium processor 55 Moore's Law has withstood for 40 years and is predicted to remain valid for at least another decade 91

Not only the miniaturization and dramatic performance improvement but also the significant drop in the price of processors has led to a situation where they are being integrated into products such as cars televisions and phones which are not usually associated with computers This new trend has also been called the disappearing computer where the computer does not actually disappear but it is everywhere 85 Digital devices containing processors now constitute a major part of our daily lives A small list of such devices includes microwave ovens television sets mobile phones digital cameras MP3 players and cars Whenever a system comprises of information processing digital devices to control or to augment its functionality such as a system termed an embedded system Therefore all the above listed devices can be also classified as embedded systems

**Proceedings of the ... USENIX Security Symposium ,2006      Code Optimization Techniques for Embedded Processors** Rainer Leupers,2013-03-09 The building blocks of today's and future embedded systems are complex intellectual property components or cores many of which are programmable processors Traditionally these embedded processors mostly have been programmed in assembly languages due to efficiency reasons This implies time

consuming programming extensive debugging and low code portability The requirements of short time to market and dependability of embedded systems are obviously much better met by using high level language e g C compilers instead of assembly However the use of C compilers frequently incurs a code quality overhead as compared to manually written assembly programs Due to the need for efficient embedded systems this overhead must be very low in order to make compilers useful in practice In turn this requires new compiler techniques that take the specific constraints in embedded system design into account An example are the specialized architectures of recent DSP and multimedia processors which are not yet sufficiently exploited by existing compilers
