Sullivan, 2013-05-17 A straightforward easy to read introduction to the finite difference time domain FDTD method Finite

difference time domain FDTD is one of the primary computational electrodynamics modeling techniques available. Since it is a time domain method, FDTD solutions can cover a wide frequency range with a single simulation run and treat nonlinear material properties in a natural way. Written in a tutorial fashion starting with the simplest programs and guiding the reader up from one dimensional to the more complex three dimensional programs, this book provides a simple yet comprehensive introduction to the most widely used method for electromagnetic simulation. This fully updated edition presents many new applications including the FDTD method being used in the design and analysis of highly resonant radio frequency RF coils often used for MRI. Each chapter contains a concise explanation of an essential concept and instruction on its implementation into computer code. Projects that increase in complexity are included ranging from simulations in free space to propagation in dispersive media. Additionally, the text offers downloadable MATLAB and C programming languages from the book support site <http://booksupport.wiley.com>. Simple to read and classroom tested, *Electromagnetic Simulation Using the FDTD Method* is a useful reference for practicing engineers as well as undergraduate and graduate engineering students. **Solutions**

Manual for Field and Wave Electromagnetics David K. Cheng, 1983 [A Synthesized Electrooptic Directional-coupler Modulator at 1300-nanometer Wavelength with Low Switching Voltage](#) Chanin Laliew, 2002. A low switching voltage electrooptic directional coupler modulator for use in analog optical communication systems at the wavelength of 1300 nanometers was investigated. Conventional optical directional couplers have a pair of their constitutive waveguides running in parallel and thus the coupling between them is constant throughout the length of the structure and this gives rise to an approximate sinc squared amplitude transfer function. This transfer or response function is nonlinear and therefore modulators based on the constant coupling directional coupler may only have a small modulation depth of about 2%–5% for analog communication systems. In this work, the directional coupler was modified by varying the etch depth between the two constitutive waveguides while keeping the spacing between them constant along the length of the structure so that the modulator's response function of the desired form was obtained and exhibited high linearity. Consequently, large dynamic range and low switching voltage operation may be realized with this directional coupler modulator. Based on this concept, the device built in AlGaAs/GaAs semiconductor material was designed, fabricated, and tested. The experimental result shows that the directional coupler modulator, which is 1.5 cm long, has a switching voltage of about 1.8 volts, one of the lowest values for electrooptic modulators built to date. With further investigation on the RF/microwave characteristics, the directional coupler modulator based on this design might prove to be promising for use in the optical communication mainstream.
