

GEOPHYSICAL METHODS OF EXPLORATION

CORE DRILLING

Core drilling can be considered both a geological and geophysical technique and can be used to determine the true vertical orientation of a horizon. The information and accuracy of the results are the foundation of seismic. Core drilling also provides the location of structural trap potential. Core drills are used frequently to measure aquifer thickness where the existing data is sparse (needed to correct downward time to depth). The two locations are determined and corrected by comparison and adjustment to known well locations. Seismic interpretation is based on geological knowledge, geophysics, and geophysical correlation. Seismic correlation is the most significant tool used to correlate stratigraphic throughout correlation areas and to identify energy reserves.

SEISMIC

Seismic behaviour data normally has velocity, travel distance, time pressure, to any velocity, dip and the direction of propagation. The information and accuracy of the results are the foundation of seismic. Seismic interpretation is based on geological knowledge, geophysics, and geophysical correlation. Seismic correlation is the most significant tool used to correlate stratigraphic throughout correlation areas and to identify energy reserves.

MAGNETIC TECHNIQUES

The magnetic method of geophysical exploration is used to determine the magnetic properties of rocks and to identify magnetic anomalies. The magnetic method is used to identify magnetic anomalies and to determine the magnetic properties of rocks. The magnetic method is used to identify magnetic anomalies and to determine the magnetic properties of rocks.

ELECTRICAL TECHNIQUES

Electrical techniques of geophysical exploration are used to determine the electrical properties of rocks and to identify electrical anomalies. The electrical method is used to identify electrical anomalies and to determine the electrical properties of rocks. The electrical method is used to identify electrical anomalies and to determine the electrical properties of rocks.

REMOTE SENSING

Remote sensing is a geophysical technique used to determine the physical properties of rocks and to identify physical anomalies. The remote sensing method is used to identify physical anomalies and to determine the physical properties of rocks. The remote sensing method is used to identify physical anomalies and to determine the physical properties of rocks.

CONCLUSIONS
 Geophysical methods are used to determine the physical properties of rocks and to identify physical anomalies. Geophysics for the Mineral Exploration Geoscientist Michael C. Dentith, Stephen T. Mudge, 2014 **Prospecting and Exploration of Mineral Deposits** M. Böhmer, M. Kucera, 2013-10-22 This is the completely revised edition of a book which was published in 1978 and such was its popularity was sold out within two years It was described as An excellent compilation and condensation of a vast field of literature and experience in economic geology Clear illustrations charts and tables punctuate the text material very nicely Valuable for all economic geologists and resource developers Choice The material is illustrated by 215 text figures and 76 tables and is presented in two parts The first part covers the geological background of the genesis of mineral deposits as a clue to new discoveries and the methods of geological geochemical and geophysical prospecting The second part concerns sampling documentation and computation of ore reserves and economic assessment of mineral deposits This new edition has been very extensively revised and brought up to date This holds true particularly for the chapters on geochemical and geophysical methods the use of photo geology and satellite imagery oil and gas prospecting exploration of underwater minerals the application of the principles of global tectonics in prospecting for deposits and the evaluation of reserves These new or thoroughly revised chapters comprise almost half of the entire text

Geophysics for Mineral Exploration Michael S Zhdanov, 2021-11-04 This Special Issue contains ten papers which focus on emerging geophysical techniques for mineral exploration novel modeling and interpretation methods including joint inversions of multi physics data and challenging case studies The papers cover a wide range of mineral deposits including banded iron formations epithermal gold silver copper iron molybdenum deposits iron oxide copper gold deposits and prospecting for groundwater resources **Geological Survey Research 1978** Geological Survey (U.S.), 1978 A summary of recent significant scientific and economic results accompanied by a list of geologic and hydrologic investigations in progress and a report on the status of topographic mapping [Prospecting and Exploration of Mineral Deposits](#) Miloš Kužvart, Miloslav Böhmer, 1978 **U.S. Geological Survey Professional Paper**, 1978 **Geophysical Technique for Mineral Exploration and Discrimination Based on Electromagnetic Methods and Associated Systems**, 2008 Mineral exploration needs a reliable method to distinguish between uneconomic mineral deposits and economic mineralization A method and system includes a geophysical technique for subsurface material characterization mineral exploration and mineral discrimination The technique introduced in this invention detects induced polarization effects in electromagnetic data and uses remote geophysical observations to determine the parameters of an effective conductivity relaxation model using a composite analytical multi phase model of the rock formations The conductivity relaxation model and analytical model can be used to determine parameters related by analytical expressions to the physical characteristics of the microstructure of the rocks and minerals These parameters are ultimately used for the discrimination of different components in underground formations and in this way provide an ability to distinguish between uneconomic mineral deposits and zones of economic
