

Progressive Waves

Learning Outcomes

- To be know the basic measurements of a wave
- To be able to calculate the speed of any wave
- To be know what phase and path difference are and be able to calculate them

Waves

All waves are caused by oscillations and all transfer energy without transferring matter. This means that a water wave can transfer energy to you sitting on the shore without the water particles far out to sea moving to the beach.

Here is a diagram of a wave; it is one type of wave called a transverse wave. A wave consists of something (usually particles) oscillating from an equilibrium point. The wave can be described as progressive; this means it is moving outwards from the source.

We will now look at some basic measurements and characteristics of waves.

Amplitude, A

The amplitude of a wave is the maximum displacement of the particles from the equilibrium position.

Amplitude is measured in metres, m

Wavelength, λ

The wavelength of a wave is the length of one whole cycle. It can be measured between two adjacent peaks, troughs or any point on a wave and the same point one wave later.

Wavelength is measured in metres, m

Time Period, T

This is simply the time it takes for one complete wave to happen. Like wavelength it can be measured as the time it takes between two adjacent peaks, troughs or to get back to the same point on the wave.

Time Period is measured in seconds, s

Frequency, f

Frequency is a measure of how often something happens, in this case how many complete waves occur in every second. It is linked to time period of the wave by the following equations: $T = \frac{1}{f}$ and $f = \frac{1}{T}$

Frequency is measured in Hertz, Hz

Wave Speed, c

The speed of a wave can be calculated using the following equations:

Wave Speed is measured in metres per second, $m\ s^{-1}$

Here c represents the speed of the wave, f the frequency and λ the wavelength.

$$c = f\lambda$$

Phase Difference

If we look at two particles a wavelength apart (such as C and G) we would see that they are oscillating in time with each other. We say that they are *completely in phase*. Two points half a wavelength apart (such as I and K) we would see that they are always moving in opposite directions. We say that they are *completely out of phase*. The phase difference between two points depends on what fraction of a wavelength lies between them

Phase Difference is measured in radians, rad

	B	C	D	E	F	G	H	I	J	K	L	M
Phase Difference from A (radians)	π	2π	3π	4π	5π	6π	7π	8π	9π	10π	11π	12π
Phase Difference from A (degrees)	180	360	540	720	900	1080	1260	1440	1620	1800	1980	2160

Path Difference

If two light waves leave a bulb and hit a screen the difference in how far the waves have travelled is called the path difference. Path difference is measured in terms of wavelengths.

Path Difference is measured in wavelengths, λ

	B	C	D	E	F	G	H	I	J	K	L	M
Path Difference from A	$\frac{1}{2}\lambda$	λ	$\frac{3}{2}\lambda$	2λ	$\frac{5}{2}\lambda$	3λ	$\frac{7}{2}\lambda$	4λ	$\frac{9}{2}\lambda$	5λ	$\frac{11}{2}\lambda$	6λ

So two waves leaving A with one making it to F and the other to J will have a path difference of 1 wavelength (1λ).
