In your textbook, read about determining wavelengths with diffraction gratings.
Click the *Icon of the book that has a question mark* to answer the question.

18. For a diffraction grating, the wavelength equals _____.
a. $\sin \theta$ b. $\sin 2\theta$ c. $\lambda \sin \theta$ **d. $\lambda \sin \theta$**

19. When monochromatic light is used with a diffraction grating, what is produced?
a. no diffraction pattern
b. no central band, but bright bands to the left and right
c. a bright central band with bright bands to the left and right

- d. a dark central band with white bands to the left and right

20. How do the screen locations of the red lines produced by red light differ on a diffraction grating compared with the locations of the red lines produced by white light?

- a. Those produced by the red light are closer.
b. Those produced by the red light are to the left.
c. Those produced by the white light are closer together.
d. They are in the same places.

21. The size of the angle between bright bands is approximately equal to ____.

- a. d/L b. L/d **c. L/d** d. d/L

22. Which quantity is not directly from the calibrated base of a grating spectrometer?

- a. θ** b. λ c. L d. r

In your textbook, read about telescopes and microscope resolution.

For each of the statements below, write true or false in the indicated space to make the statement true.

23. wider Doubling the width of a lens used in a telescope causes the diffraction pattern to become narrower.
24. true Two stars will be just resolved if the central bright band of one star falls on the first dark band of the second star.
25. narrower The diffraction pattern formed by blue light in a microscope is wider than that formed by red light.
26. microscopes only Using a larger lens is practical in reducing effects of diffraction on the resolving power of both microscopes and telescopes.
27. true White light would be more useful than green light in reducing diffraction patterns formed in a microscope.
28. more spread out Telescope diffraction causes light from a star to appear as a fuzzy disk.

Understanding Physics Second edition is a comprehensive yet compact introductory physics textbook aimed at physics undergraduates and also at engineers and other scientists taking a general physics course Written with today's students in mind this text covers the core material required by an introductory course in a clear and refreshing way A second colour is used throughout to enhance learning and understanding Each topic is introduced from first principles so that the text is suitable for students without a prior background in physics At the same time the book is designed to enable students to proceed easily to subsequent courses in physics and may be used to support such courses Mathematical methods in particular calculus and vector analysis are introduced within the text as the need arises and are presented in the context of the physical problems which they are used to analyse Particular aims of the book are to demonstrate to students that the easiest most concise and least ambiguous way to express and describe phenomena in physics is by using the language of mathematics and that at this level the total amount of mathematics required is neither large nor particularly demanding Modern physics topics relativity and quantum mechanics are introduced at an earlier stage than is usually found in introductory textbooks and are integrated with the more classical material from which they have evolved This book encourages students to develop an intuition for relativistic and quantum concepts at as early a stage as is practicable The text takes a reflective approach towards the scientific method at all stages and in keeping with the title of the text emphasis is placed on understanding of and insight into the material presented *The Science Teacher*, 1987
