attempts to conserve the multiple voltage states i.e. consumes the available states densely or compactly Using the multiple voltage states originally for securing more storage capacity for the service of multiple write operations per a single erase operation can enhance device lifetime in scenarios where there is no need of such a large storage capacity As for case iii motivated by our observation that the state of the art over provisioned OP flash capacity partitioning strategies are not optimal from a device lifetime angle while they certainly help to provide a guaranteed service level to each of co running workload we propose a strategy using which one can explore the OP partitioning space and determine a lifetime optimal OP partitioning that minimizes the collective number of write operations coming from garbage collection GC thus maximizing device lifetime Our extensive experimental evaluations based on simulation I/O traces from real workloads for cases i and ii and emulation real applications for case iii demonstrate that our proposed techniques i ii and iii can improve the device lifetime by 6.8x 27.9% and 43% on average respectively against a conventional SLC flash a conventional MLC flash and a state of the art lifetime agnostic OP partitioning strategy Also all our proposed approaches lead to improved performance e.g. response time and throughput or provide at least the same level of performance when compared to a baseline that does not consider device lifetime explicitly

Characterization of TLC Flash Memory Zachary Taylor Blair, 2017 Flash memory manufacturers are increasing storage density by leveraging multi bit per cell NAND flash technology in the latest process nodes Error rates and endurance can be significantly altered in each generation and the manufacturers provide conservative guidelines for these metrics Deeper understanding of the physical characteristics of flash devices can be used to develop a usage model which improves lifetime and reliability We developed a System on Chip SoC platform for flash memory testing including a hardware memory controller and software for pattern generation and data processing We have used the platform to characterize properties of a Triple Level Cell TLC flash memory device from a single vendor and found behaviors have significantly changed from previous generations Among these novel findings manufacturers have built compensation mechanisms for some worst case behaviors such as inter cell interference ICI but other effects become inherently more significant in the latest technologies With information about how certain behaviors affect reliability in both the short term and toward the end of the product lifetime this work provides speculation on the goals for coding schemes which target error mitigation

*Resistive Random Access Memory*  
Liang Zhao, 2015

Recently the rapid development of big data and internet of things has fueled a surge of demand for semiconductor memories As the scaling of NAND flash is hitting its physical limits several emerging non volatile memory technologies are being studied intensively to enable higher memory density and better performance Among them resistive random access memory RRAM has attracted tremendous interests due to its ability to overcome the inherent limitations of flash memory while also delivering cost effectiveness robust performance and small footprint Despite its promising features several challenges remain to be addressed for the future development and commercialization of RRAM technology First of all the physical mechanisms behind resistance change phenomena have not been fully understood making it difficult to optimize the device performance Secondly the reliability of RRAM should be improved in several aspects such as the variability of switching parameters the retention endurance failures caused by the random nature of filament formation as well as the requirement for a high voltage forming process Moreover it is also highly desired to stack RRAM devices in a 3D architecture and or develop multi level storage capability to reduce the cost per bit and compete with NAND flash This thesis presents an in depth analysis of some state of the art techniques to tackle these challenges from three aspects the materials the device structure as well as the characterization methods From the material s perspective doping technology of RRAM is investigated as an approach to improve RRAM performance Ab initio modeling and simulations are applied to study the effects of dopant types dopant concentrations oxide phases and oxide stoichiometry on the electronic and thermodynamic properties of oxygen vacancies in HfO<sub>2</sub> The physical insights derived from the calculations provide guidelines to achieve desirable RRAM characteristics through doping In the aspect of electrical characterization the pulse train characterization techniques are developed for the multi level control and in depth physical understanding of conductive filament evolution By adopting pulse train operation for an RRAM device with 3 bit potential the relative standard deviations of resistance levels are improved up to 80% compared to the single pulse scheme The observed exponential relation between the saturated resistance and the pulse amplitude provides supporting evidence for the gap formation model during the RESET process of RRAM From the device structure point of view the feasibility of ultra thin HfO<sub>2</sub> RRAM is investigated which helps to achieve the forming free property and low power operation The theoretical scaling limit of HfO<sub>x</sub> thickness is first estimated using density functional theory within the non equilibrium Green s function formalism The feasibility of 2 nm HfO<sub>x</sub> RRAM is predicted for large area

devices and verified by fabricating both planar and 3D vertical RRAM devices The 3D ultra thin devices demonstrate promising characteristics including ON OFF ratio 100 switching speed 20 ns endurance 10<sup>8</sup> cycles and data retention 10 years at room temperature In contributing to these areas this thesis aims at advancing both the fundamental understanding and practical implementation of RRAM technology towards the vision of high density mass storage applications
