Dc Motor Speed Control Using Pid Controllers:

PID Digital Controller for DC Motor Speed Using MC68HC11 Microcontroller Sharon Peterus, 2008 The proportional integral derivative PID controllers are widely used in many industrial control systems for several decades since Ziegler and Nichols proposed their first PID tuning method This is because the PID controller structure is simple and its principle is easier to understand than most other advanced controllers On the other hand the general performance of PID controller is satisfactory in many applications For these reasons the majority of the controllers used in industry are of PI PID type PID controllers are widely used for process control applications requiring very precise and accurate control The purpose of the motor speed controller is to take a signal representing the demanded speed and to drive a motor at that speed The controller does not actually measure the speed of the motor Thus it is called an Open Loop Speed Controller Motors come in a variety of forms and the speed controller s motor drive output will be different dependent on these forms The speed controller presented here is designed to drive special dc motor which is not easily available anywhere in store thus it is a good example to be used due to the special characteristics and parameters Matlab Simulink is an important tool used in this project from designing the mathematical model of the dc motor obtaining the transfer function and designing the PID controller using both model and programming using m files The transfer function will be linearized and used for tuning the gain of PID controller like KP KI and KD Simulink is chosen to simulate the performance of the control system **Speed**

Control of DC Motor Using PID Controller Implementation with Visual Basic Nurul Izzati Pandak Jabo, 2008 The project focused on speed control of DC motor The main objective is to design and develop GUI software for speed control experiment where PID controllers design approaches has been applied The controllers have been designed and the system is simulated using MATLAB to analyze their initial performance The computer is connected to DC Motor via data acquisition card DAQ Card and Visual Basic is used to conduct the experiment Field testing is implemented to compare the results between the original and modified system with the PID controller Finally the performance of the system is analyzed and validation is done in terms of time response robustness and percentage of error **Control and Information Sciences I.**

Engineering for Mechatronics and Automation Fernando Martell, Irma Y. Sanchez, 2024-06-14 Production processes and

engineered systems use continuous and discrete variables as well as the combination of continuous and sequential operations. This volume covers both aspects thus providing knowledge in continuous and discrete control logic control and hybrid control systems. It is a compilation of selected control strategies to automate processes and systems with a practical approach to ease their design analysis and implementation. The selection of the control schemes is based on the capability to provide desired dynamical response or real time performance. Practicality is required for achieving faster development times of automation projects or system prototypes by comprehensive presentation and direct application of methodologies and techniques for efficient and structured programming of control algorithms. Considered methodologies include model based design hardware in the loop simulations and structured programming. Fundamental signals and systems concepts are explained. Systems and controllers are analyzed using discrete time equations which ease their implementation in most programmable platforms without requiring sophisticated software. PID based control, internal model control and model reference control are viewed as powerful schemes in terms of performance and suitability for mechatronics systems because of the use of the model in their architecture as a key control element. Finite state machines are presented to solve sequential requirements of direct and supervisory control of many processes and machines. Cyberphysical systems are an industrial technology and an education trend distinguished by visual and dynamic models or digital twins of the physical systems. The discussed analysis, design and implementation practices are integrated and applied in the context of cyberphysical systems. This book aims to provide multidisciplinary support to engineers and practitioners in the design of control systems and is a valuable tool for automation teaching and self learning.

Speed Control of DC Motor Using PID Controller Implementation with PLC Muhammad Ezra-Ezwan Mat Aris, 2008. The idea of motor speed control is to keep the rotation of the motor at the set speed. When used in speed applications, speed feedback control of the DC motor's speed or confirms that the motor is rotating at the desired speed. To maintain the speed, it requires the speed feedback at all times. The objective of this project is to use the algorithm of Proportional Integral Derivative (PID) controller to control the speed of the DC motor using Programmable Logic Controller (PLC) implementation. The use of PLC in this project will help to reduce complexity and is easy to troubleshoot. The model of PLC which is used in this project is OMRON CQM1H CPU51 and the program for this controller system is in ladder diagram (CX programmer). The PID is implemented in the PLC program so that the system has a better response and less error. Finally, analysis of the response is made after the PID is implemented into the system.
